CMSC 330: Organization of Programming Languages

OCaml Data Types

Review: Fold

```
let rec fold left f a l =
 match 1 with
  [ ] -> a
  | h::t -> fold left f (f a h) t
let rec fold right f l a =
 match 1 with
  [ ] -> a
  | h::t -> f h (fold right f t a)
```

Review: Fold

```
fold_left (+) 0 [1;2;3]
fold_left (+) 1 [2;3]
fold_left (+) 3 [3]
fold_left (+) 6 []
6
```

```
fold_right (+) [1;2;3] 0
1 + (fold_right (+) [2;3] 0)
1 + (2 + (fold_right (+) [3] 0))
1 + (2 + (3 (fold_right (+) [] 0)))
1 + (2 + (3 + 0)) 1 + (2 + 3)
1 + 5
6
```

OCaml Data

- So far, we've seen the following kinds of data
 - Basic types (int, float, char, string)
 - Lists
 - > One kind of data structure
 - > A list is either [] or h::t, deconstructed with pattern matching
 - Tuples and Records
 - > Let you collect data together in fixed-size pieces
 - Functions
- How can we build other data structures?
 - Building everything from lists and tuples is awkward

(User-Defined) Variants

List.iter print gen ls

```
type gen =
   |Int of int
   |Str of string;;
let ls = [Int 10; Str "alice"]
let print gen lst =
  match 1st with
   |Int i->Printf.printf "%d\n" i
   |Str s-> Printf.printf "%d\n" s
```

Variants (full definition)

- Syntax
 - type t = C1 [of t1] | ... | Cn [of tn]
 - the **Ci** are called constructors
- Evaluation
 - A constructor *Ci* is a value if it has no assoc, data
 - > Ci vi is a value if it does
 - Destructing a value of type t is by pattern matching
 - > patterns are constructors *ci* with data components, if any
- Type Checking
 - Ci [vi] : t [if vi has type ti]

Data Types: Variants with Data

```
type shape =
   Rect of float * float
   | Circle of float
```

```
let area s =
  match s with
    Rect (w, 1) -> w *. 1
    | Circle r -> r *. r *. 3.14

;;
area (Rect (3.0, 4.0));; (* 12.0 *)
area (Circle 3.0);; (* 28.26 *)
```

[Rect (3.0, 4.0); Circle 3.0]. (* shape list*)

Quiz 1

```
type foo = ((string list) * int) list
```

Which one of the following could match type **foo**?

```
A. [("foo", "bar", 5)]
B. [(["foo", "bar"],6)]
c. [([("foo", "bar")],8)]
D. [(["foo"; "bar"],7)]
```

Quiz 1

```
type foo = ((string list) * int) list
```

Which one of the following could match type **foo**?

```
A. [("foo", "bar", 5)] string * string * int) list
B. [(["foo", "bar"],6)]((string*string) list*int) list
c. [([("foo", "bar")],8)] same as B
D. [(["foo"; "bar"],7)] (string list * int) list
```

Quiz 2: What does this evaluate to?

```
type num = Int of int | Float of float;;
let aux a =
   match a with
   | Int i -> i
   | Float j -> int_of_float j
;;
aux (Float 5.0);;
```

- A. 5
- в. 2
- c. **5.0**
- D. Type Error

Quiz 2: What does this evaluate to?

```
type num = Int of int | Float of float;;
let aux a =
   match a with
   | Int i -> i
   | Float j -> int_of_float j
;;
aux (Float 5.0);;
```

- A. 5
- в. 2
- c. **5.0**
- D. Type Error

Option Type

```
type optional_int =
   None
| Some of int
```

```
let divide x y =
  if y != 0 then Some (x/y)
  else None

let string_of_opt o =
  match o with
    Some i -> string_of_int i
  | None -> "nothing"
```

Comparing to Java: None is like null, while
 Some i is like an Integer (i) object

Polymorphic Option Type

```
type 'a option =
   Some of 'a
| None
```

```
let opthd 1 =
   match 1 with
    [] -> None
    | x::_ -> Some x
```

Quiz 3: What does this evaluate to?

```
let foo f = match f with
    None -> 42.0
    | Some n -> n +. 42.0
;;
foo 3.5;;
```

- A. 45.5
- в. 42.0
- c. **Some 45.5**
- D. Error

Quiz 3: What does this evaluate to?

```
let foo f = match f with
   None -> 42.0
   | Some n -> n +. 42.0
;;
foo 3.5;; foo (Some 3.5)
```

- A. 45.5
- в. 42.0
- c. **Some 45.5**
- D. Error

Recursive Data Types: List

```
type 'a mylist =
   Nil
 | Cons of 'a * 'a mylist
let l = Cons (10, Cons (20, Cons (30, Nil)))
let rec len = function
   Nil \rightarrow 0
 | Cons ( , t) -> 1 + (len t)
```

Recursive Data Types: Binary Tree

```
type 'a tree =
   Leaf
 | Node 'a tree * 'a * 'a tree
let empty = Leaf
let t = Node(Leaf, 100, Node(Leaf, 200, Leaf))
let rec sum t =
 match t with
    Leaf -> 0
   \mid Node(1,v,r)-> sum 1 + v + sum r
```

OCaml Exceptions

```
exception My_exception of int
let f n =
  if n > 0 then
    raise (My exception n)
  else
    raise (Failure "foo")
let bar n =
  try
    f n
 with My exception n ->
      Printf.printf "Caught %d\n" n
     Failure s ->
      Printf.printf "Caught %s\n" s
```

OCaml Exceptions: Useful Examples

- failwith s: Raises exception Failure s (s is a string).
- Not found: Exception raised by library functions if the object does not exist
- invalid arg s:Raises exception Invalid_argument s

```
let div x y =
  if y = 0 then failwith "div by 0" else x/y;;
let lst =[(1,"alice");(2,"bob");(3,"cat")];;
let lookup key lst =
  try
  List.assoc key lst
  with
  Not_found -> "key does not exist"
```
